Abstract:

The lack of patron ship, organizational attention and unified approach towards the development of a standard keyboard layout has brought in chaos and issues.

The 30 years of war has torn the institutions of Afghanistan and thus any developments taking place during this era are due to individual endeavors. These individual endeavors are worth praise and gratitude but lacks a unified and organized vision towards the development of standards in developing local technologies, and thus failed to bring Pashto into the line of developing languages in technology.

The lack of consistency in the work already done in regard of keyboard layout is one of the main initiating factors of this research report.

The inconsistent keyboards developed by individuals and/or organizations sponsored individuals are always based on the old non scientific, non statistical keyboard layouts, and modified copies of Arabic, Farsi keyboard layouts.

This paper highlights the works done by individuals and identifies the demerits of the designed keyboard layouts.

The paper discusses the development and implementation of a scientific keyboard based on the frequency analysis of the Pashto character set. It also compares and evaluates the typing efficiency of this scientific statistics based keyboard.

Introduction

During the 1980's and back, a great need was felt for the digitized production and publications in Pashto. Both the government in Kabul and the afghan jihadist movements in Peshawar were acquiring the ability to produce high quality digitized publications in Pashto.

Newspapers and magazines were typed by the regular typing machines, which lacked the beauty, variety of fonts, attractive design, and easiness of composing work.

Computer systems at that time did not have graphical interface, it was a difficult task to make a new system for Pashto language. People at that time worked hard to design and make a solution for this problem. Therefore it is important to mention the pioneers in this field especially those who contributed their hard work and efforts to the afghan community for free.

Recently work has been done in keyboard layout designing; based on the older keyboard layouts and in order to meet the emergency needs- one of the layouts was approved by ministry of communications of Afghanistan.

As need and requirements of every language and nation vary, the need for more research was felt in order to design a keyboard layout based on scientific research, just Imitating keyboards of other languages doesn't comprehensively address the issues of Pashto language and Pashto typing. The history of Pashto keyboard layout makers is recorded here in respect to the date of the work done.

An abstract of the received emails about the keyboard layout history is presented here:

Note: Most emails are the exact wordings of the contacted persons with slight modifications.

Mr. Wadan [kader.wadan@titaniasoft.com]

This is a summary of Mr. Wadan's efforts in Pashto keyboard layout creation.

In 1989 he participated in Berlin- a meeting about the availability of typewriters for the Pashto language. The result of the pre discussions that had taken place in Afghanistan was to order IBM typewriter machines. As he heard about this he suggested not to order typewriter machines but to buy a computer and install proper software for the Pashto language. He mentioned the known advantages of a computer based system over a typewriter and the audience was enthusiastic about the abilities such an alternative brings with it. And so he was asked to provide such a system. At that time he didn't knew that there was no proper program for the Pashto language that fulfill the given requirements. The only possibility existed, was the software developed by the company Gamma Universe. Their program called "Scholar" was text oriented. One had to write encrypted text with English letters from left to right and a second program converted these to Arabic and Pashto letters after it was sent to the printer. Meanwhile –after 1990- they have changed this, so one can read the written text already on screen.

In 1989 he had to provide software based on WYSIWYG (What You See Is What You Get). He decided to develop new software from scratch. He got an invitation from the Kabul University to teach programming and modeling in the C language. His aim was to demonstrate programming strategies in C and develop a word processing program for Pashto. He planned to implement this program in three modules simultaneously during lectures to demonstrate the theoretical techniques.

He developed a prototype for each module to see that wanted goals can be achieved.

The three modules consisted of:

- 1. **font drawing** :a visual program consisted of a matrix to draw the individual pixels of a font
- 2. word processing :a WYSIWYG based visual program
- **3.** A printer driver : The driver was written for 24-Pin printers for the Pashto fonts that he defined by the font drawing and definition module

All three modules were functional, but still they were, prototypes. The keyboard assignment was phonetic it was hardwired in the source code.

He was disappointed that C language was not known, there was no programming experience in Kabul University. So he had to teach the very fundamental aspects of the C-Language. There were no resources for the project he had in mind and so the development of the word processing program for the Pashto language remained at the prototype stage. But it was completely functional software with the necessary features.

There exists an interview with Mr. Wadan on November / December 1989 in AFG-TV, where you can see this program in action.

Mr. Noorulhoda Atel

He started working on the Pashto fonts and keyboards in 1991 using MLS V.3 (Multilingual Scholar), which was a DOS-based basic multilingual text editor, with many useful functions and rather simple to use interfaces for keyboard and font creation and editing. His work was widely used by NGOs working in Peshawar up to 1995. To mention some: Swedish Committee for Afghanistan (SCA), International Rescue Committee (IRC), the Dutch Committee for Afghanistan (DCA), and other composing organizations i.e. Right Type composing center.

In early 1994 he came across a multilingual add on for WordPerfect 5.0 (which also worked with WP 5.1 and he used it with the later version) and started developing Pashto fonts and keyboards for it. The part time development work took about 6 months and was completed in September 1994. DCA was the first organization which started using the adapted WP 5.1 for serious work as soon as it was made available and continued using it up to 1998. The Livestock Program of Afghanistan was the second organization who adopted the software and used to publish multiple books and other publications. Many other NGOs and UN organizations also used the software. Experienced users could use this version of WP 5.1 with a practicality equivalent to very advanced text processing software and using LaserJet printers, it was possible to produce quality publications with this software. Organizations who had expert WP 5.1 users continued using this software up to 2002 even when multilingual operating systems and text processor were available.

Mr. Liwal [info@liwal.net]

Mr. Liwal the owner of the Asia-soft and the current giant of the market didn't provide any information based on the business strategy.

Mr.Sherzad Kamawall [kamawall@hotmail.com]

Kamawal started working on keyboard layout in 2002. At the same time Said Marjan Zazay (Afghanan.net) was also working on his version of a keyboard. Actually it was Zazay who suggested him to program a keyboard.

After a while he found out that another person from NWFP (www.khpalapashto.com) also had made his own keyboard layout.

His biggest problem in creating Pashto layout was the lack of knowledge about character frequencies and detailed knowledge of Pashto alphabets. He mapped the characters at that time to lewal's layout or khpalapashto's as he can't remember exactly.

He also had trouble with the lack of a standard Pashto font. There was "Pashto Kror Asiatype" Font by Liwal. Marjan had also created some beautiful fonts. "Pashto Kror Asiatype" had some bugs (it still has).

The Other figure in Pashto keyboard history that helped Mr. Sherzad was Mr. Abdulhaleem Yousufzay (mashriqsoft jalalabad) in creating a font which he named it Pokhto.ttf. It's now widely used in the internet web pages.

Mr. Said Marjan Zazay [www.afghanan.net]

Said Marjan Zazai is the managing director of AestheTech Software based in Peshawar, Pakistan. AestheTech Software is a software development company which emphasizes on localization. Previously Zazai has been involved in Unicode Font development for Pashto language. While in Kabul he worked voluntarily for ministry of communications of Afghanistan as a Pashto localization expert together with Everson Typography (www.evertype.com) to standardize the Pashto/Dari keyboard layouts and worked on collation and locale for Pashto language. He also due to the business strategy didn't provide any information.

Mr. Mobtakir:

On Monday, May 30, 2005 we got email from Mr. Mubtakir about his request to Microsoft Company to help him legalize his proposed Pashto keyboard to be used both in Afghanistan and Worldwide. But regrettably he did not share with us his proposed Pashto keyboard layout due to his business strategy.

About Mobtakir:

Mr. Mobtakir was an English teacher in Aeronautical Schools in Kandahar/Kabul before joining UNESCO in 1960 as Assistant to Chief of UNESCO Mission.

He founded the First Management, Secretarial, and Typing Private School in Kabul, Afghanistan in 1964. He was also importing and distributing typewriters in Afghanistan for the last 26 years

Meeting:

Recently a meeting was arranged with Mr. Mobtakir about the keyboard and the need to make a keyboard with scientific bases. He complained about the current imitated keyboard layouts based on Arabic and Persian keyboards. He encouraged us to start the work for making scientific based Pashto keyboard layout.

Definitions:

Keyboard is a hardware input device consisting of an array of keys that the user presses in order to enter text into the computer.

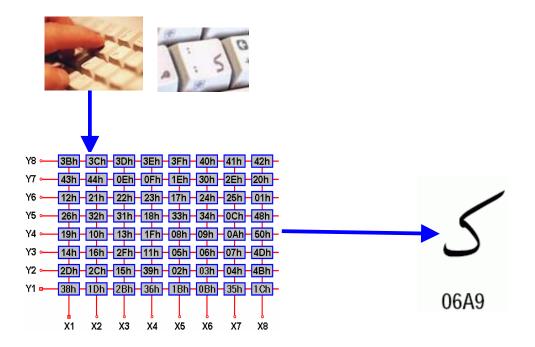

Dead key A key press or modifier-plus-key press combination that produces no immediate effect, but instead modifies the character or characters produced by the next key (called the completer key) that is pressed. In Pashto writing it is was used in Liwal keyboard layout.

Keyboard layout is the specification of the physical arrangement of keys on a keyboard and the characters produced when those keys are pressed. It is the software that connects the hardware [Keyboard] to the system. Keyboards of each country may have different locations for the keys arrangement

There are large number of keyboard layouts used for different languages written for different scripts, i.e. Roman script, Arabic script, Han-gul script, Latin script, each have many languages that uses them.

How keyboard works:

- Explanation:
 - User presses a key
 - Key have scan code
 - Keyboard layout software maps the scan code and sends it to the OS then to application.

The Idea:

The idea of developing a Pashto keyboard layout was visualized after a research study of the previous keyboards. After a thorough study of previous keyboards we came to know that these layouts were made without any reasonable bases; but were mere imitation of the Farsi and Arabic keyboards, ignoring and by passing the language contents, the usage frequency of alphabets and the efficiency of Pashto typing.

Beginning of the search

There was a more need for developing a more efficient keyboard based on scientific reasons and statistical analysis. We started collecting information on the structure of certain keyboards like QWERTY, DVORAK, XPeRT, ABKEY keyboards, and the new design of a Hindi keyboard. Many Pashto keyboard layouts were researched as well which are presented later in this report.

As there was an objective of developing a keyboard based on the frequency analysis of Pashto alphabets. The procedures used in the development of the new keyboards were carefully analyzed.

Pashto keyboard layouts:

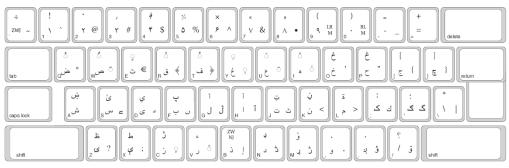

Fig 1. Michael Everson and Roozbeh Pournader layout. (MoC approved).

The above layout is implemented by Habiburahman using Microsoft keyboard layout creator (MsKLC). This layout was not available for MS windows, and the current available in MS windows is not compatible with Everson keyboard layout.

When comparing the official Pashto keyboard layout for Afghanistan (made by Everson, Roozbeh, Marjan Zazai, & Tamim Noori) and the Pashto keyboard layout made by Walter Bender. There were many differences.

For details please check the following table and image:

(yellow color shows the difference with walter keyboard layout.)

Note:

• Key AD01 shifted status key is mentioned by Walter to be Arabic Sukun which is 0652 Unicode but is mentioned FE7E by Walter table.

• Key AE04 shifted status is the Afghani currency sign which is 060b Unicode, but is mentioned e60b by Walter table.

From the market

The market was checked for old type writers and found that most look like the following enhanced image:

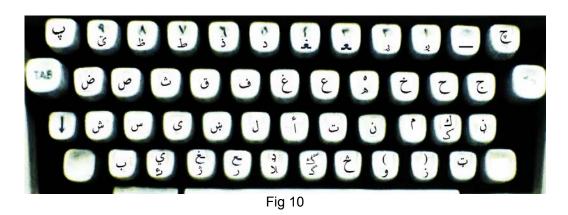

Fig 11

Conclusions:

This survey conclude that

- There is no standard keyboard layout.
- The layouts are not based on scientific reasons.

These inconsistent keyboard layouts create problems on the user side and also adversely affects in development of a unified non variant language content and corpus.

Problems found in Everson keyboard layout:

- Based on Arabic keyboard layout.
- He made two more layouts for Dari and Uzbek that could be handled in Pashto keyboard layouts. For more explanation check the following image:

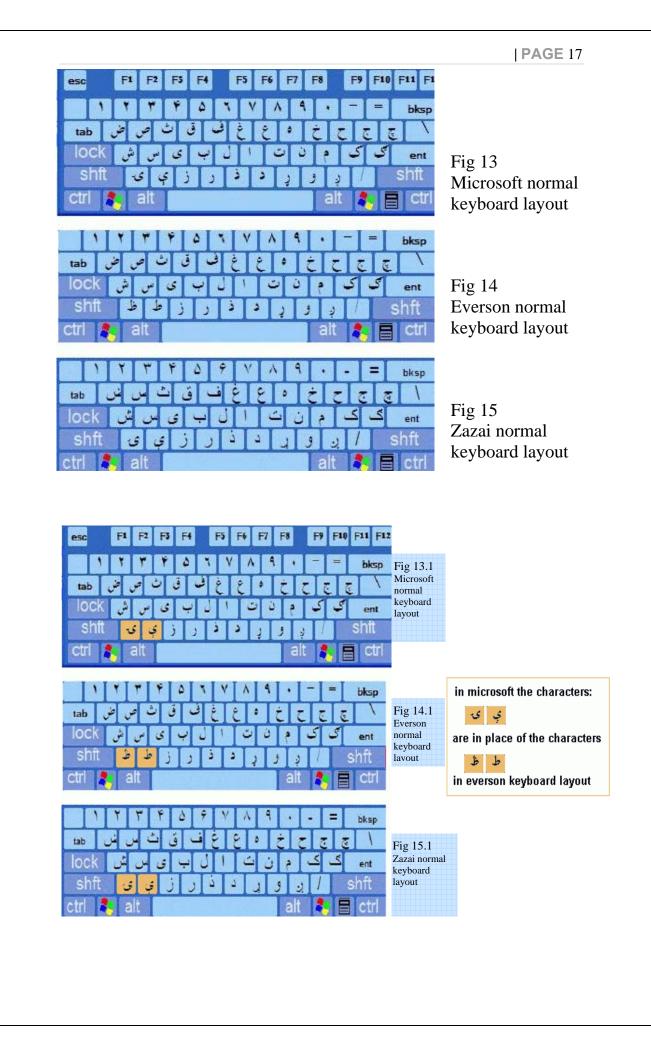

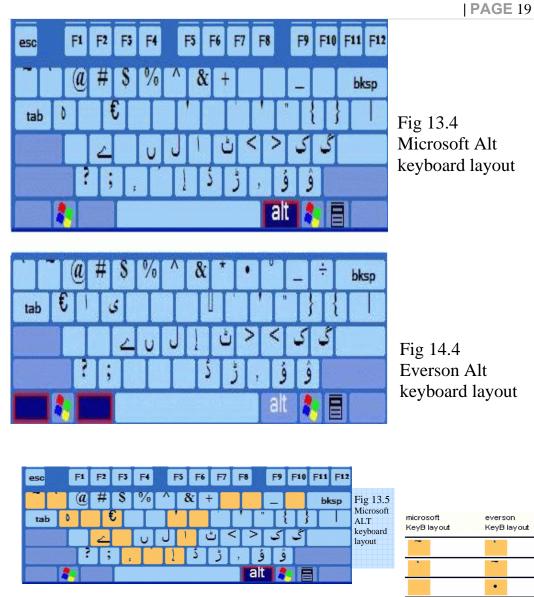

The colored squares indicate the scattered characters position that shows how hard it is for the typist to remember the different layouts for the different languages. And that it all can be under Pashto keyboard layout.

Comparison between Microsoft / Everson Keyboard layouts:

- This document shows the difference in layout between Microsoft keyboard layout and Everson which is also known by "TolAfghan keyboard layout"
- The keyboard layout out by Michael Everson and his associates (Roozbeh Pournader, Zazai) is the layout that was recognized and attested by Ministry of Communications in Afghanistan.
- Microsoft keyboard layout is therefore not compatible with the Everson and associates keyboard layout.

Comparison between Everson / Liwal Keyboard layouts

- The keyboard layout by Michael Everson and his associates (Roozbeh Pournader) is the layout that was recognized and attested by Ministry of Communications in Afghanistan.
- Liwal keyboard layout is therefore not compatible with the Everson and associates keyboard layout. And also it is not based on scientific bases.

Fig 16

The yellow highlighted characters show the difference of Liwal keyboard layout with Everson keyboard layout.

Conclusion:

 The keyboard layout by Michael Everson and his counterparts (Roozbeh Pournader), Liwal, Zazai, Sherzad, and others – are based on Arabic and Persian keyboard, keyboards are developed without any research or study of the Pashto characters frequencies which is a fundamental step towards the development of modern keyboard layout.

The first part of the frequency analyzer:

The first part of the program is used to analyze the Pashto characters frequency. This program reads Pashto text files and decomposes the Text into characters. It then checks each character repetition and counts them. The output is then shown in a text box which generates an html file for the users and a text file as an input for another program to be used in the second phase.

Language and Tools Used

The program was developed using VB.Net 2005 Beta version, but due to some problems with the beta version VB.Net 2003 was used. No code has been written for error handling. Users need to be careful while using the program or might end up with errors. This Program only deals with analyzing the text files.

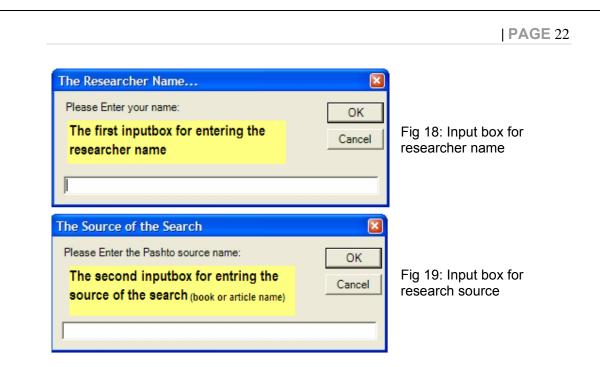

Using the analyzer

Pashto text files are needed as an input for this program. Once the input is provided it starts analyzing it, it might take from 5 seconds up to 3 minutes or more depending on the system speed and the text files size.

Once the program finishes analyzing, two files are generated as outputs (one html file for the user to read and one text file for another program for further processing).

pashto frequency_69204_habib_pashtobook.txt

Testing and Verification

A basic test was conducted in order to verify the results of the program with different text and different users. Copies of the software were provided to linguists for the reason. It was found that the results generated were correct.

The input Corpus

2 -

We need to have a large amount of digitized text in Pashto that's to be analyzed. Large amount of the text will help identify the correct frequencies of the characters. The aim was to analyze up to 50 MB of Pashto text files, but unfortunately there were not enough reachable formats available.

The e-corpus used for analyzing

Digitized text had to be searched and then to be used as an input. Computer science magazine and other internet resources were researched. Some websites offered Pashto books and articles in html format, which were then converted to text files.

The total amount of text Mr. Habiburahman was able to get was about 12 MB. Many organizations were visited for getting some digitized text only one organization provided 28 MB of Pashto text, but was not suitable for the research because it was in a conversational format, and had a lot of repeated text, which would give wrong statistical results.

As Pashto has some variance in writings, the same as the variance in speaking, due to different dialects of the different tribes and regions, it would have been better to analyze more than 12MB of the text to reflect more accurate results.

Second part of the Frequency analyzer:

The second part of the program is used to collect the analyzed results of the first program and show the overall statistics of all analyzed files in one file.

Languages and Tools Used

This part of the program was also developed using VB.Net 2003, contains no error handling. This program only deals with the collection of the analyzed data.

Using this part of the Analyzer

After analyzing the Pashto text files with the first part of the analyzer, this second part of the analyzer reads and collects the statistics of these files.

This program sums up the character statistics of the files being analyzed. The output of this program is a single html file, which shows the files processed and the total statistics. As many files can be added for analysis using the "ACCUMULATE" button and then "MAKE HTML" button to show the statistical results of the frequencies.

The output file: (if you are reading this document in .doc format you can double click to open this attachment)

The statistical results:

Analyzed output of about 6,000,000 Pashto characters corpus.

Although the aim was the analysis of characters up to 25,000,000 but due to the lack of digitized Pashto text, we stopped at 6 Million characters; other issues arose as well during this research which are mentioned later in this document.

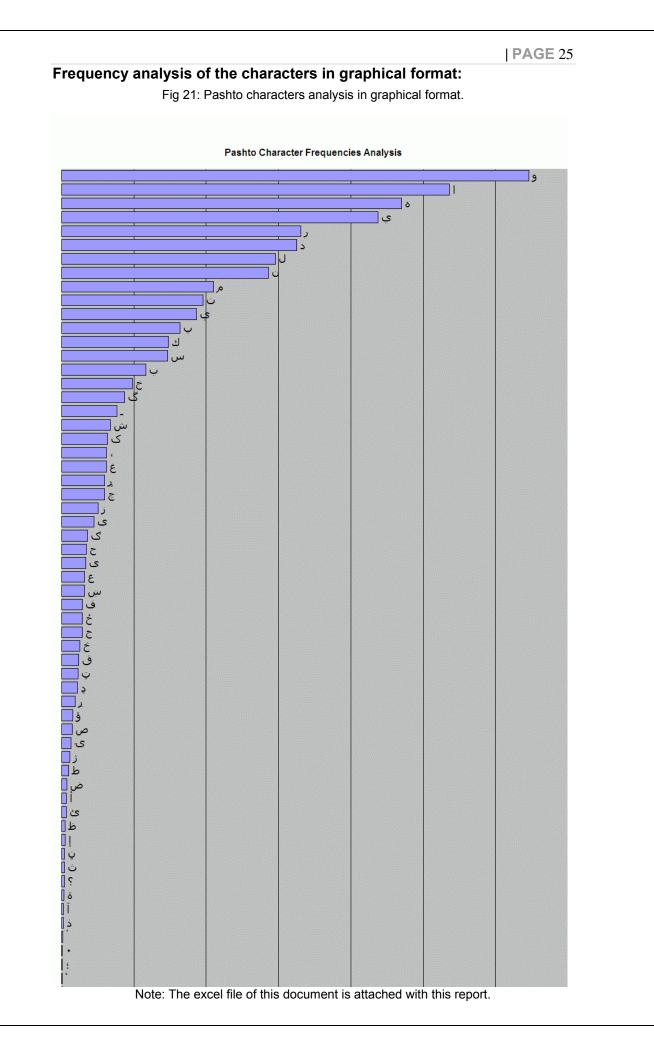

The analyzing of 12MB of Pashto text resulted in

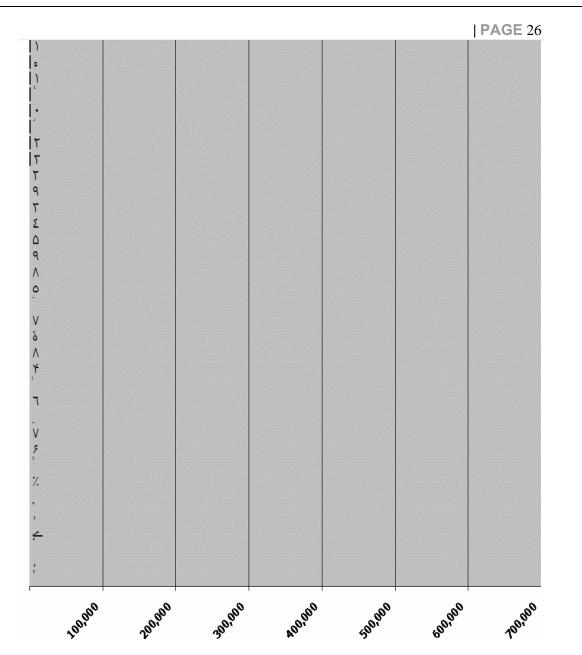

Total words:	1892096
Total characters:	7769909

Second phase of Pashto keyboard research and development

It is known that the typist speed and accuracy is affected by the distribution of Characters over a keyboard. If the most used characters are scattered away the typist speed will be lower, and there will be more stress on the typist nerves and fingers.

In this phase we are going to make a new Pashto keyboard layout design. This design will be based on the first phase research output by knowing Pashto characters frequencies. Because every finger has specific strength and accessibility, for example the index finger is more prominent in accessibility and strength so it should have the highest frequency letters. The keyboard rows as well vary in accessibility. The middle row is the most accessible. The higher frequency letters will be placed in the base row/middle row/home row. This will result in less stress and less time consumption.

This new keyboard layout is cold tested for efficiency using the frequency of the characters and the movement of the fingers. The statistical calculation of the time consumed is attached here with this report. For the reason of practical testing, the keyboard is published and is tested through new keyboard learners in order to know the efficiency and learning curve (time and speed) of the new layout.

Target Keyboard Layout provision:

- To be easier to learn for beginners.
- Produce a higher typing speed for a typical computer user.
- Usage of Agile Inner Fingers (forefinger and middle finger).
- Reduction of typing errors.
- Reduction in Finger Reach and stress, minimize the typing effort.
- Less fingers travel.

Previous known keyboard layouts:

Dvorak keyboard 💥

The Dvorak Simplified Keyboard is a keyboard layout patented in 1936 by Dr. August Dvorak, [an educational psychologist and professor of education at the University of Washington in Seattle, Washington], and William Dealey as an alternative to the more common QWERTY layout. This keyboard was a result of significant ergonomic research and is known to outperform the standard QWERTY keyboard.

- August Dvorak 1936. Increased accuracy in typing by almost 50 % and speed by 15-20 %
- Fingers stay on the home row 70% of the time. The world record speed on Dvorak is 225 wpm.
- Dvorak estimated that the fingers of an average typist in his day travelled between 12 and 20 miles on a QWERTY keyboard; the same text on a Dvorak keyboard would require only about one mile of travel.
- Dvorak believed that 'hurdling' and awkward keystroke combinations were responsible for most common typing errors.

The Dvorak layout was designed to address the problems of inefficiency and fatigue which characterized the QWERTY keyboard layout. The QWERTY layout was introduced in the 1860s, being used on the first commercially-successful typewriter, the machine invented by Christopher Sholes. The QWERTY layout was designed so that successive keystrokes would alternate between sides of the keyboard so as to avoid jams. Some sources also claim that the QWERTY layout was designed to slow down typing speed to further reduce jamming.

Mrs. Barbara Blackburn of Salem, Oregon can maintain 150 wpm for 50 min (37,500 key strokes) and attains a speed of 170 wpm using the Dvorak Simplified Keyboard (DSK) system. Her top speed was recorded at 212 wpm. Source: Norris McWhirter, ed. (1985,(*THE GUINNESS BOOK OF WORLD RECORDS*23,rd US edition, New York: Sterling Publishing Co., Inc. **X**

QWERTY keyboard

QWERTY (pronounced / kwerti/) is the most common modern-day keyboard layout on English-language computer and typewriter keyboards. It takes its name from the first six letters seen in the keyboard's top first row of letters. The QWERTY design was patented by Christopher Sholes in 1868 and sold to Remington in 1873, when it first appeared in typewriters. It was designed to "slow down" typing, to prevent the types from jamming.The QWERTY keyboard is also a commonly used nickname to name the English language keyboard.

DVORAK Keyboard Layout (Characters Frequency)

The above images show where the most frequently used keys lie on different keyboard layouts.

What's wrong with the QWERTY layout? %2

- It places very rare letters in the best positions, so your fingers have to move a lot more .
- It suffers from a high same finger ratio that slows down typing and increases strain .
- It allows for very long sequences of letters with the same hand (e.g. "sweaterdresses").
- It was designed to prevent the keys from sticking, without any consideration to ergonomic or efficiency aspects .
- It was designed so the word "typewriter" could be typed on the top row to ease demonstrations .
- It suffers from an extremely high ratio of home-row-jumping sequences e.g. ("minimum")
- QWERTY is very boring to learn because very few meaningful words can be formed with the keys on home row. Thus typing tutors typically have students typing nonsense for the first several lessons.

What's wrong with the Dvorak layout? 💥

- The main problem with Dvorak is that it's too difficult and frustrating to learn for existing QWERTY typists because it's so different from QWERTY.
- It is based on English as spoken in 1934.
- A new typist may take several months to really become fluent on Dvorak layout.

Pashto Typing:

Typing in Pashto in contrast to English doesn't have a long history. Still foundations are being laid down and is the right time to take into consideration scientific and logical measures for any steps to be taken in the development of techniques and technologies in Pashto Language.

So we are in need of developing a keyboard based on characters' frequencies. Following is the calculation of Pashto characters frequency and frequency based analysis of previous keyboards.

The different colors used in the frequency tables and in the Keyboard layouts are clarified in the file attached with the report.

Pashto characters frequency:

	r		-				1			
Frequency	Character	color	Decimal	Hexa		32,109	ع		1593	63
646,235	و		1608	648		31,596	ښ		1690	69

Analyzed corpus summary:

Over all Total words: 1892096

Over all Total characters:

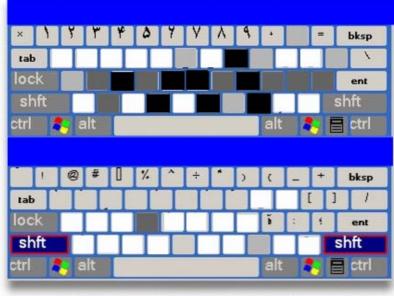

7769909

Famous keyboard layouts design analyzing:

(Everson, Liwal, Tolafghan) keyboard layouts have the same position for the top 8 Pashto characters:

(ن ل د ر ي ه ۱ و)

For the typing machine the top used characters are more scattered to keep typing slow and prevent typing heads from jamming

The new keyboard layout development

The following two keyboard layouts were proposed based on the frequencies of the characters, the colors specify different frequencies of the characters.

Note: See the attachment for frequency color specifications.

Proposed Pashto keyboard layout without considering the old layout

Acknowledgments:

The work of this research report has been extensively carried by Habiburahman Najiullah. It's due to all his endeavors that this work has been possible. Other colleagues and peers contributed to the very foundation of this research. Omar Mansoor Ansari the then leader of the project was highly effective at initiating the work successfully. In addition we would like to extend our gratitude and thankfulness to the following for their cooperation and support.

- > Majeedullah Qarar
- Pan localization
- Ustaz Mohammad Asif Samim
- Sharifullah Mahboob
- > Da ulomo academy (academy of sciences Afghanistan)
- > Haron Wardak for his help in searching and finding some keyboard layouts.

Hameedullah Sherani Country Project Leader PANL MoCIT, Kabul, Afghanistan.
